Hackathon Ops Workflow — Features by User

Portal module: event operations, judging, results & wrap-up

Every feature is event-scoped and enabled per hackathon (config toggles). Existing events are unaffected until the coordinator switches the features on.

Department Coordinator (Admin)

1. **Schedule the hackathon** — create the event with dates, description, problem statements and department; lifecycle **UPCOMING** → **ACTIVE** → **JUDGING** → **CLOSED**.
2. **Fill details** — event page content, rubrics (categories + weights), registration window, featured placement.
3. **Assign students to venues** — create venues (name, capacity), assign teams individually or in bulk; unassigned-team warnings before judging; capacity enforced.
4. **Add and assign judges** — add judges (existing faculty roles), assign each to a venue (or all claims); judges only see their venue's teams.
5. **Communicate notices** — post announcements (title, body, file attachment, pin) visible on the event page; students upload PPT/docs within the submission window (deadline enforced).
6. **Consolidate results** — per-claim scoreboard across categories and judges, filterable by venue.
7. **Visit the scores** — **change if needed** — override any category score with a reason; category caps enforced; full before/after audit trail; allowed during **JUDGING** only.
8. **Declare the results openly** — advance event to **CLOSED**; results (rankings, final scores, identity-free judge comments) become public on the event page.
9. **Dashboard analytics** — participants, teams, attendance and insights analytics with CSV export (existing module).
10. **Take feedback from students** — collect one rating + comment per student after results; review list with CSV export.
11. **Upload final report, photos/videos** — event gallery: final report (PDF), photos, videos with captions, public on the event page.

Student

1. **See the general rubrics** — rubric categories and weights visible on the event page before registering.
2. **Login and register** — sign in (email/UID, or Google), register the team, add details and select a problem statement.
3. **Upload PPT / docs** — submit presentation and supporting documents before the submission deadline (window enforced).
4. **See all details on the portal** — event info, problem statements, notices, venue assignment, team details in one place.

5. **View results and comments** — after results are declared: ranking, final scores, and judge comments (without judge identities).
6. **Give feedback** — one rating + comment about the event once results are out.

Judge

1. **Get assigned and see the rubrics** — coordinator assigns you to a venue (or all claims); rubric categories and weights always visible.
2. **Judge and give scores** — score each assigned team per category (caps enforced); scores saved per round.
3. **2× revisit** — multi-round judging: coordinator advances rounds; you can revise scores inside the open round; earlier rounds kept for audit.
4. **Comments** — optional per-category comment alongside each score; students see them only if the coordinator enables it (identities stripped).
5. **Scoped queue** — you only ever see the teams assigned to your venue; nothing else is visible.

How it is enabled

Each capability is a per-event toggle (**config**): venues, notices, team docs, judge rounds, score review, comments to students, feedback, media/report, public results.

A coordinator turns the required features on when creating the event; every other event keeps today's behavior.

Delivery order: Phase 1 — venues, judges, notices (operations backbone) • Phase 2 — score review, comments, rounds (judging depth) • Phase 3 — feedback, media/report, public results (wrap-up)
